Maintenance Resource Prediction Model (MRPM) Individual Facility System Programmer's Manual

by
Edgar S. Neely
Robert D. Neathammer
Bill Wang

The Maintenance Resource Prediction Model (MRPM) is a computer system designed to assist in planning and programming maintenance resources, based on the anticipated resource requirements of actual installation facilities, for prediction periods of 1 to 10 years.

This manual provides system programmers with a comprehensive description of each procedure required to learn, operate, and maintain the personal computer MRPM individual facility system.

The data base and computer system are presently used by U.S. Army Corps of Engineers (USACE) designers at district and installation levels, and by resource programmers at the USACE Headquarters, Army Major Command, and installation levels. These products may also prove useful to other Government agencies and to the private sector.

FOREWORD

This research was conducted for the Office, Chief of Engineers, under various RDTE and FAD funding documents. Work began under RDTE in 1980 and continued in reimbursable projects from 1984 through 1989. The technical monitor was Mr. Edmund Davis (CEHSC-FM-R).

The work was performed by the Facility Systems Division (FS), U.S. Army Construction Engineering Research Laboratory (USACERL). Assistance was provided by Mr. James Stirn and Mr. Kurt Giehler of USACERL. The primary contractor on much of the data development was the Department of Architectural Engineering, Pennsylvania State University. Dr. Michael J. O'Connor is Chief, USACERL-FS. Technical editing assistance was provided by Linda Wheatley, USACERL Information Management Office.

COL Everett R. Thomas is Commander and Director of USACERL, and Dr. L.R. Shaffer is Technical Director.

**MAINTENANCE RESOURCE PREDICTION MODEL (MRPM)
INDIVIDUAL FACILITY SYSTEM PROGRAMMER'S MANUAL**

1 INTRODUCTION

The primary purpose of this manual is to provide the system programmers with a comprehensive description of each procedure required to learn, operate, and maintain the personal computer MRPM individual facility system. Chapter 2 describes the most efficient method for learning the functions and organization of the MRPM system. Chapter 3 defines the program flow from subroutine to subroutine. Chapter 4 contains the description of all standard or common subroutines that must be used by all programmers when writing new code or modifying existing code. Chapter 5 describes all standard common blocks that must be used when programming. Chapter 6 contains a list of standard programming packages used in the MRPM system. Chapter 7 describes the procedures to be followed during system maintenance and operation. Chapter 8 describes the overall management procedures required to operate the system. Chapter 9 describes resources required to support the MRPM system.

2 LEARNING THE FUNCTIONS

The first and most important step is to train the maintainer as a functional user of the system. Give the new person a user's manual and access to the MRPM system on a personal computer (PC). Have the person read the manual, learn the system, and write down all questions. Do not give the person any verbal description of the system. All information should be contained in the user's manual.

Revise the user's manual as needed using the programmer's questions. If the new person had the question, it is probable others will also. This method constantly improves both user and system documentation.

The user's manual is a self-teach document. The learning process takes approximately 1 week and should be very smooth and efficient. Once the maintainer knows the functions, this programmer's manual can be used.

3 PROGRAM FLOW

This chapter presents the flow of the program by functional use. Table 1-A contains the functional use as displayed on the screen, the program named, and the files as tables accessed. Table 1-B contains the same information ordered by program name. Table 1-C contains the information ordered by file name.

4 STANDARD SUBROUTINES

Table 2 contains an alphabetical list of all standard subroutines with descriptions. Each subroutine is defined in detail.

Table 2
Standard Subroutines

```
*****
* Name      = ansist
* Author    = Bobby Adams
* Function  = To perform various ansi-standard routines by sending the
*              appropriate sequence of commands to the terminal. Note,
*              the command parameter (com) can be in upper or lower case.
* Usage     = character com*3
*              integer*2 prm1, prm2
*              call ansist (com, prm1, prm2)
* Parameters =
*              com - SGR (select graphic rendition)
*              prm1 - 0 (turn all attributes off)
*                     1 (increase screen intensity)
*                     4 (dim screen intensity)
*                     5 (blinking)
*                     7 (reverse video)
*              prm2 - not used (use 0 for consistency)
*              com - HVP (horizontal and vertical position)
*              prm1 - 1-24 (row in which to place cursor)
*              prm2 - 1-80 (column in which to place cursor)
*              com - CUU (cursor up, doesn't change column position)
*              prm1 - number of rows to move up (won't move above top margin)
*              prm2 - not used (use 0 for consistency)
*              com - CUD (cursor down, doesn't change column position)
*              prm1 - number of rows to move down (won't go below bottom margin)
*              prm2 - not used (use 0 for consistency)
*              com - CUF (cursor forward, doesn't change row position)
*              prm1 - number of cols to move right (won't go past right margin)
*              prm2 - not used (use 0 for consistency)
*              com - CUB (cursor backward, doesn't change row position)
*              prm1 - number of cols to move left (won't go past left margin)
*              prm2 - not used (use 0 for consistency)
*              com - ED (erase in display, clear screen)
*              prm1 - not used (use 0 for consistency)
*              prm2 - not used (use 0 for consistency)
*              com - EL (erase in line)
*              prm1 - 0 (erase from cursor position to the end of line, inclusive)
*                     2 (erase the entire line)
*              prm2 - line number to erase
* Returns   = None.
* Calls     = fsc.lib: upper compac
* Commons   = None.
*****
```

```
*****
* Name      = box (assembler routine) *
* *
* Author    = Russ Hougland *
* *
* Function  = Draws a box with an upper left corner at (x1,y1) and a lower *
*             right corner at (x2,y2). The sides of the box are either *
*             single lines (type = 1) or double lines (type = 2). A box can *
*             also be erased (type = 0). *
* *
* Usage     = integer*2 x1, y1, x2, y2, type, att *
*             call box (x1, y1, x2, y2, type, att) *
* *
* Parameters =
*             x1 - row of the upper left hand corner *
*             y1 - column of the upper left hand corner *
*             x2 - row of the lower right hand corner (x2 must be > x1) *
*             y2 - column of the lower right hand corner (y2 must be > y1) *
*             type - 0 (blank lines, erase a box) *
*                   1 (single line box) *
*                   2 (double line box) *
*             att - the screen attribute to use on the box (see wt) *
* *
* Returns   = None. *
* *
* Calls     = None. *
* *
* Commons   = None. *
*****
```

```
*****
* Name      = cd (convert date) *
* *
* Author    = Russ Hougland *
* *
* Function  = Converts a date from the internal storage format to the *
*             format specified. *
* *
* Usage     = character fmt*01, cd*11, date*11, newdate*11 *
*             newdate = cd (date, fmt) *
* *
* Parameters =
*             date - the date to be converted (must be in the internal format of *
*                   'YYYY/MMM/DD' i.e. '1985/001/01') *
*             fmt  - the date format to convert to (can be lower or upper case) *
*                   'E' (english format of 'MMM/DD/YYYY' i.e. 'JAN/01/1985') *
*                   'M' (metric format of 'DD/MMM/YYYY' i.e. '01/JAN/1985') *
* *
* Returns   = The converted date stored in cd. If the date passed is empty *
*             or in error, cd returns an empty date (i.e. ' / / ') *
* *
* Calls     = fortran: ichar *
* *
* Commons   = None. *
*****
```

```
*****
* Name      = cdat
*
* Author    = Kevin Stewart
*
* Function  = Converts a date from the internal database storage format to
*              a real number (YYYY. + MM/12) that is to the nearest month.
*
* Usage     = real*4  num, cdat
*              character date*11
*              num = cdat (date)
*
* Parameters =
*              date - the date to be converted (in internal format 'YYYY/MMM/DD')
*
* Returns   = The date as a real number (YYYY. + MM/12).
*
* Calls     = fsc.lib:  iconv
*
* Commons   = None.
*****

```

```
*****
* Name      = chkbit (assembler)
*
* Author    = Russ Hougland
*
* Function  = Checks whether a bit is set or reset.
*
* Usage     = integer*2 code, bit
*              logical*2 i, chkbit
*              i = chkbit (code, bit)
*
* Parameters =
*              code - variable to check
*              bit  - the bit in variable (code) to check (0 - 15)
*
* Returns   = True if the bit is set.
*
* Calls     = None.
*
* Commons   = None.
*****

```

```
*****
* Name      = clrbox (clear box)
*
* Author    = Russ Hougland
*
* Function  = Clears the interior area of a box with the upper left-hand
*              corner at (x1,y1) and the lower right-hand corner at (x2,y2).
*              The attribute of the interior is determined by attr.
*
* Usage     = integer*2 x1, y1, x2, y2, attr
*              call clrbox (x1, y1, x2, y2, attr)
*
* Parameters =
*              x1  - row of the upper left hand corner
*              y1  - column of the upper left hand corner
*              x2  - row of the lower right hand corner (x2 must be > x1)
*              y2  - column of the lower right hand corner (y2 must be > y1)
*              attr - attribute of the interior of the box (see wt)
*
* Returns   = None.
*
* Calls     = fsc.lib: scroll
*
* Commons   = None.
*****

```

```
*****
* Name      = clrmmod (color mode - assembler)
*
* Author    = Russ Hougland
*
* Function  = To determine if the user's computer is in the color mode.
*
* Usage     = logical*2 clrmmod, i
*              i = clrmmod ()
*
* Parameters = None.
*
* Returns   = clrmmod
*
* Calls     = None.
*
* Commons   = None.
*****

```

```
*****
* Name      = cmp2sd (compare to system date) *
* *
* Author    = Russ Hougland *
* *
* Function  = To compare a date to the system date. *
* *
* Usage     = character dat*11
*             integer*2 flag
*             call cmp2sd (dat, flag)
* *
* Parameters =
*             dat - the date to be compared (must be in internal format i.e.
*                   'YYYY/MMM/DD')
*             flag - indicates results of the comparison
*                   -1 (if the date is before the system date)
*                   0 (if the two dates are equal)
*                   +1 (if the date is after the system date)
* *
* Returns   = flag (indicates results of comparison).
* *
* Calls     = fsc.lib: sysdat
* *
* Commons   = None.
*****
```

```
*****
* Name      = command *
* *
* Author    = Russ Hougland *
* *
* Function  = Execute a DOS command from within a program. *
* *
* Usage     = logical*2 error
*             character cmnd*(*)
*             call command (cmnd, error) or
*             call command ('dir *.for'c,error)
* *
* Parameters =
*             error - true if an error occurred during execution.
*             cmnd - character variable containing the DOS command to execute (if
*                   a variable is used, the string contained by it must be
*                   terminated with a null).
*             literal - if the DOS command to be executed is contained in a literal
*                   string, the letter c must follow immediately after the string.
* *
* Returns   = if error is true, a message will have been written to the
*             file error.dat
* *
* Calls     = fsc.lib: rpterr
*             fortran: system
* *
* Commons   = None.
*****
```

```
*****
* Name      = compac
*
* Author    = Bobby Adams
*
* Function  = Moves all blank characters in a string to the end of the
*             string and returns the number of characters in the string.
*
* Usage     = integer*2 num
*             character str(*)*
*             call compac (str, num)
*
* Parameters =
*             str - the string variable of any length
*             num - the number of non-blank characters in the string
*
* Returns   = It returns num, the length of character string stored in str.
*
* Calls     = fortran:  len
*
* Commons   = None.
*****

```

```
*****
* Name      = contain (logical function)
*
* Author    = Russ Hougland
*
* Function  = Determines if a substring (sub) is contained within another
*             string (str).
*
* Usage     = logical*2 contain, i
*             character sub(*), str(*)
*             i = contain (str, sub)
*
* Parameters =
*             str - the string to search
*             sub - the substring to search for
*
* Returns   = contain is true if the substring is found within the target
*             string.
*
* Calls     = fortran:  len
*
* Commons   = None.
*****

```

```
*****
* Name      = csort
*
* Author    = Russ Hougland
*
* Function  = This is an interface to a sort routine (written in c by Steve
*             Dorner and also contained in fsc.lib). It will sort a
*             file using multiple keys in either ascending or descending
*             order.
*
* Usage     = integer*4 addr1, addr2, locfar
*             character control(*), filen(*)
*
*             addr1 = locfar (control)
*             addr2 = locfar (filen)
*             call csort (addr1, addr2)
*
* Parameters =
*   addr1   - the address of the control string
*   addr2   - the address of the name of the file to be sorted
*   filen   - character string containing the name of the file to be sorted.
*             the file name must be terminated with a null.
*   control - a character variable containing the command string for the
*             sort. the command string must be terminated with a null.
*             the format of control is as follows:
*               if first character is 's', second character specifies
*               the field separator character.
*               followed by zero or more words of the form:
*                 [b][c|n][r][<m>][.<n>][-[<m2>][.<n2>]
*                 b ignore leading blanks
*                 c ignore case
*                 n numeric comparison
*                 r reverse order
*                 <m> field number
*                 .<n> begin column
*                 <m2> end field number
*                 .<n2> end column
*
* Returns   = None.
* Calls     = fsc.lib: sort
* Commons   = None.
*****
```

```
*****
* Name      = csrpos (assembler routine)
*
* Author    = Dan Weidenfeld
*
* Function  = To position the cursor.
*
* Usage     = integer*2 row, col
*             call csrpos (row, col)
*
* Parameters =
*   row - the row to position to - 1 (0-24)
*   col - the column to position to - 1 (0-79)
*
* Returns   = None.
*
* Calls     = None.
*
* Commons   = None.
*****
```

```
*****
* Name      = cursor (assembler routine)
*
* Author    = Russ Hougland
*
* Function  = Change the type of cursor used.
*
* Usage     = integer*2 type
*             call cursor (type)
*
* Parameters =
*             type - 0 (no cursor)
*                   1 (underline cursor)
*                   2 (dash cursor)
*                   3 (overscore cursor)
*                   4 (block cursor)
*                   5 (bottom-half block cursor)

*                               green  32
*                               red   64
*                     blinking       : 128
*
*                     to get the desired color simply sum the numbers of the desired
*                     attributes, for example: to get a blinking white text on a
*                     black background attr = 1 + 2 + 4 (white foreground)
*                               + 0          (black background)
*                               + 128        (blinking)
*
* Returns   = None.
*
* Calls     = None.
*
* Commons   = None.
*****
```

BTRIEVE CALLS

FUNCTION : INTERFACE WITH THE BTRIEVE TO ACCESS A SPECIFIED FILE

USAGE : INTEGER*2 STS, FILBLK(64), REC(N), LREC, LKEY, OP, KEYNUM
CHARACTER KEY*N
CALL BTREE(FILBLK, OP, KEYNUM, KEY, LKEY, REC, LREC, STS)

PARAMETERS : FILBLK - STORES THE FILE NAME AND PATH, CURRENT RECORD
POINTER

OP - THE TYPE OF OPERATION TO BE EXECUTED
(i.e. OPEN, UPDATE, ect.)

KEYNUM - THE KEY PATH USED IN ALL FILE OPERATIONS
** NOTE **

THE KEYNUM USED MUST BE A VALID KEY SPECIFIED
DURING THE FILES INITIAL OPERATION.

KEY - CONTAINS THE KEY FIELD OF THE RECORD

LKEY - LENGTH OF KEY FIELD IN BYTES

REC - INTEGER*2 ARRAY CONTAINING RECORD DATA

LREC - LENGTH OF RECORD IN BYTES

STS - CONTAINS THE STATUS OF THE OPERATION PERFORMED
RETURN ZERO IF NORMAL OPERATION

NOTE : WHEN CREATING AND OPENING FILES, THE FILE NAME IS IN THE
'KEY' FIELD AND THE FILE NAME LENGTH IS IN THE 'LKEY'
FIELD, example:

CALL BTREE (FILBLK, 0, 0, 'FILE.XDB', 8, REC, LREC, STS)

BTRIEVE OPERATIONS (for detail information see Btrieve menu Chap. 9)

(0) - OPEN

PURPOSE - TO OPEN A BTRIEVE FILE

(1) - CLOSE

PURPOSE - TO CLOSE A BTRIEVE FILE

(2) - INSERT

PURPOSE - TO INSERT A RECORD IN A FILE

(3) - UPDATE

PURPOSE - TO UPDATE AN EXISTING RECORD IN A BTRIEVE FILE

(4) - DELETE

PURPOSE - TO DELETE AN EXISTING RECORD IN A BTRIEVE FILE

(5) - GET EQUAL

PURPOSE - TO RETRIEVE A RECORD FROM A BTRIEVE FILE CORRESPONDING
TO A SPECIFIC KEY VALUE

(6) - GET NEXT

PURPOSE - TO RETRIEVE A RECORD FROM A BTRIEVE FILE WHICH FOLLOWS
THE "CURRENT RECORD"

(7) PURPOSE - GET PREVIOUS
- TO RETRIEVE A RECORD FROM A BTrieve FILE WHICH PRECEDES
THE "CURRENT RECORD"

(8) PURPOSE - GET GREATER
- TO RETRIEVE A RECORD FROM A BTrieve FILE CORRESPONDING
TO THE KEY VALUE WHICH IS GREATER THAN A SPECIFIC KEY VALUE

(9) PURPOSE - GET GREATER OR EQUAL
- TO RETRIEVE A RECORD FROM A BTrieve FILE CORRESPONDING
TO THE KEY VALUE WHICH IS GREATER OR EQUAL TO A SPECIFIC
KEY VALUE

(10) PURPOSE - GET LESS THAN
- TO RETRIEVE A RECORD FROM A BTrieve FILE CORRESPONDING
TO THE KEY VALUE WHICH IS LESS THAN A SPECIFIC KEY VALUE

(11) PURPOSE - GET LESS THAN OR EQUAL
- TO RETRIEVE A RECORD FROM A BTrieve FILE CORRESPONDING
TO THE KEY VALUE WHICH IS LESS THAN OR EQUAL TO A SPECIFIC
KEY VALUE

(12) PURPOSE - GET LOWEST
- TO RETRIEVE A RECORD FROM A BTrieve FILE CORRESPONDING
TO THE LOWEST KEY VALUE FOR A SPECIFIED ACCESS PATH.

(13) PURPOSE - GET HIGHEST
- TO RETRIEVE A RECORD FROM A BTrieve FILE CORRESPONDING
TO THE HIGHEST KEY VALUE FOR A SPECIFIED ACCESS PATH.

(14) PURPOSE - CREATE
- TO CREAT A BTrieve FILE WITH THE SPECIFIED SET OF
CHARACTERISTICS

(15) PURPOSE - STAT
- TO RETRIEVE A SPECIFIED FILE'S CHARACTERISTICS

(16) PURPOSE - EXTEND
- TO EXTEND A BTrieve FILE TO A SECOND LOGICAL DISK DRIVE

(17) PURPOSE - SET DIRECTORY
- TO SET THE CURRENT DIRECTORY TO A SPECIFIED VALUE

(18) PURPOSE - GET DIRECTORY
- TO RETRIEVE THE "CURRENT" DIRECTORY

(19) PURPOSE - BEGIN TRANSACTION
- TO MARK THE BEGINNING OF A SET OF LOGICALLY RELATED BTrieve
OPERATIONS.

(20) PURPOSE - END TRANSACTION
- TO COMPLETE A TRANSACTION AND COMMIT THE OPERATIONS PERFORMED
SINCE THE TRANSACTION BEGAN

(21) PURPOSE - ABORT TRANSACTION
- TO REMOVE ALL OPERATIONS PERFORMED SINCE THE BEGINNING OF
AN ACTIVE TRANSACTION AND TO TERMINATE THE TRANSACTION.

(22) PURPOSE - GET POSITION
- TO RETURN THE PHYSICAL POSITION OF THE RECORD IN THE BTrieve
FILE THAT HAS BEEN ESTABLISHED AS THE "CURRENT RECORD"

(23) - GET DIRECT
PURPOSE - TO RETRIEVE THE DATA RECORD POSITIONED AT A SPECIFIED
ADDRESS IN THE BTrieve FILE.

(24) - STEP DIRECT
PURPOSE - TO RETRIEVE THE DATA RECORD IN THE LOCATION PHYSICALLY
FOLLOWING THE CURRENT RECORD IN THE BTrieve FILE.

(25) - STOP
PURPOSE - TO TERMINATE THE RECORD MANAGER AND REMOVE IT FROM MEMORY.

BTRIEVE ERROR CODES

(For detailed information see Btrieve menu Appendix B ERROR CONDITIONS)

A utility program (STS.EXE) is available to prompt Btrieve Error Condition and Fortran Runtime Error.

```

sixf4c : six right most F4C code

6 STANDARD PROGRAMMING PACKAGES

These programming packages are used by the MRPM system:

1. MSFORTRAN 3.31
2. BTRIEVE
3. MS CHART

Each package has its own printed documentation.

7 MAINTENANCE AND OPERATIONS PROCEDURES

To ensure system uniformity, programmers should follow these instructions:

1. Always get source codes from and return them to the coordinator; do not update the execution file in the main machine. Only the coordinator is allowed to write into the main machine.
2. Test the program as you work on it, and make sure it is 100 percent error free. Write down all testing procedures for future reference.
3. The first line of each screen should be a header that contains the exact words of the selection menu.
4. Always show the computer status on the screen: 'COMMAND MODE', 'EDIT MODE', 'ADD MODE'; this helps users know where they are.
5. When the user presses 'F8' to delete records, always ask to make sure the data should be deleted.
6. Use the bottom line for standard functions. Show only functions that can be used in this mode.
7. On reports and lists to the printer, be sure to print the last page.
8. Use the 'F6 BEGIN' key to start the processing on all functions.
9. Programs must return to the previous screen after successful execution.
10. Use the standard error message subroutine "ERRMSG" to handle all the pop-up window style error messages.
11. Always make a source code backup before working on it. Always save the final program on a diskette in your diskette file. Write the date on the diskette.
12. There is no 'STOP' command in the program.
13. Increase labels in increments of 100.

Table 4 is an example of a well-documented program.

8 MANAGEMENT PROCEDURES

The success of the MRPM system depends greatly on the response the functional user receives to questions and problems reported to the operators/maintainers through the system telephone hotline. A toll-free 800 number should be provided to all users. This hotline should be used to report possible improvements, enhancements, questions, problems, and system failures. Top priority must be given to providing the user with a fast response to all problems and questions.

A three-part report log, shown in Figure 1, has been designed to assist in the management of the user requests. Each report log is assigned a unique sequential number for tracking purposes. The persons making and receiving the report are recorded with the message. The hotline operator will take immediate action to answer questions. All actions taken should be noted on the form. The function name should be kept when a specific function is being addressed. The red copy should be filed in the official logbook until the action is complete.

Many reports logs must be reviewed by a supervisor to determine what action must be performed, the priority of the log, and the person that must process the log. The white and yellow copies can be sent to the processor.

The processor should take all actions as soon as possible and record the action on the report log. All pertinent information should be given to the supervisor for review. The processor keeps the yellow copy as a record.

For quality assurance, the reviewer should analyze the entire command to ensure that it works completely. This is the most important step in ensuring a working system.

The problem log is returned to the hotline operator who will call the original reporter and relate the action taken. This step ensures the original user is kept informed. The completed white form replaces the red action form in the official report logbook.

The system supervisor should review the problem logs periodically to ensure that progress is being made on problem resolution. Written and oral feedback to all participants is required to maintain a good working environment.

A periodic newsletter should be mailed to each system user. The newsletter should include a short description of new features requested by the users. Include the user's name and organization, giving as much credit to the user as possible. Make sure that users know the system exists to support them. Give short summaries of changes to the system since the last newsletter.

Periodic system updates should be scheduled as needed by problem corrections and additions.

The most important part of the management process is training of system operators and maintainers. Both onsite and periodic Army-wide training courses should be offered for system users to be kept current.

9 RESOURCES

Five basic functions must be maintained to provide full-service system support:

1. Supervision
2. Functional user training
3. Hotline
4. PC system maintenance
5. Newsletter.

Supervision

The supervisor's functions include scheduling training; review and assignment of report logs; and management of all corrections, improvements, and problem identification. This function will consume approximately 25 percent of a person year at a GS-11 level, which would be approximately \$12,000/yr.

Functional User Training

There are three types of training:

1. Self-teach using the user's manual.
2. Onsite training of users.
3. Centralized training.

For the self-teach method, the user must have access to someone who can answer questions as the self-teaching progresses. This function is usually performed by the Hotline Operator.

Onsite training entails sending one person to a site for a minimum of 3 days. The installation provides equipment and the training room. The cost for each such session would be:

GS-11 trainer, 5 days @ \$200/day	\$1000
TDY, 4 days @ \$100/day, plus air and car	1000
Supplies, manuals, etc.	300
Total	\$2300

This is by far the best possible training method for both the trainer and the students. Five classes/yr at \$2300 each would be \$11,500.

Centralized training is the most expensive way for the Army to train. All students must travel to one central site. The central site must rent computer equipment that will probably not be the type used by any of the students at their installations. Training facilities must be obtained. A central Army training center must be paid to plan and conduct the training. During this training, there should be no more than two students assigned to one PC. Estimated costs would be:

GS-11 trainer, 5 days @ \$200/day	\$1000
TDY, 4 days @ \$100/day, plus air and car	1000
Supplies, manuals, etc.	300
Computer rental (if available), \$100/day @ 3 days	300 each
Room rental, \$100/day @ 3 days	300
Student TDY, 4 days \$100/day plus air	800 each
For a class of 20 students (10 computers)	Total <u>\$21,600</u>

Hotline

The hotline is a telephone number that is used to support users by answering user questions, handling user problems, and accepting suggestions for improvement. This number is given to all users. The person answering the hotline should be able to either answer all basic problems, obtain the answer quickly, or refer the request to someone else for action. This activity would require about 15 percent of one GS-9 or \$8000/yr.

PC System Maintenance

One standard system will be required at an initial purchase cost of \$35,000. Annual system hardware maintenance costs would run \$2000/yr. The U.S. Army Construction Engineering Research Laboratory (USACERL) will transfer the system to the U.S. Army Engineering and Housing Support Center (USAEC) at a cost of \$20,000. Two GS-9 Fortran programmers must be trained on the use of the system. Training will take 6 months at a cost of \$30,000. Normal annual requirement will be the equivalent of one half-time person at a cost of \$15,000/yr.

Newsletter

A quarterly newsletter should inform users of updates and answers to common questions. The annual cost is estimated at \$5000.

Cost Summary

Initial Costs

USACERL transfer	\$20K
Personal computer	\$35K
Fortran program (2 at 6 mo)	\$30K
Total	\$85K

Annual Costs

Supervisor (1/4 time)	\$12K
User training - five classes onsite	\$12K
Hotline (15 percent)	\$8K
PC maintenance	\$2K
Fortran programmer (1/2 time)	\$15K
Newsletter	\$5K
Basic supplies	\$4K
Total	\$58K
